

# Capstone Project

## Bike Sharing Demand Prediction

By – sumit zoting

# Problem statement

The contents of the data came from a city called Seoul. A bike-sharing system is a service in which bikes are made available for shared use to individuals on a short term basis for a price or free. The data had variables such as date, hour, temperature, humidity, wind-speed, visibility, dew point temperature, solar radiation, rainfall, snowfall, seasons, holiday, functioning day and rented bike count. The problem statement was to build a machine learning model that could predict the rented bikes count required for an hour, given other variables

# Points to discuss

- Data description and summary
- Analysis of categorical variable
- Analysis of numerical variable
- Handling outliers
- Regression plot
- Machine learning algorithms
- conclusion

# Data description

The dataset contains weather information (Temperature, Humidity, Windspeed, Visibility, Dewpoint, Solar radiation, Snowfall, Rainfall), the number of bikes rented per hour and date information.

- Date : year-month-day
- Rented Bike count -Count of bikes rented at each hour
- Hour -Hour of the day
- Temperature-Temperature in Celsius
- Humidity - %
- Windspeed - m/s
- Visibility - 10m
- Dew point temperature - Celsius
- Solar radiation - MJ/m<sup>2</sup>
- Rainfall - mm

# Data description(cont,.)

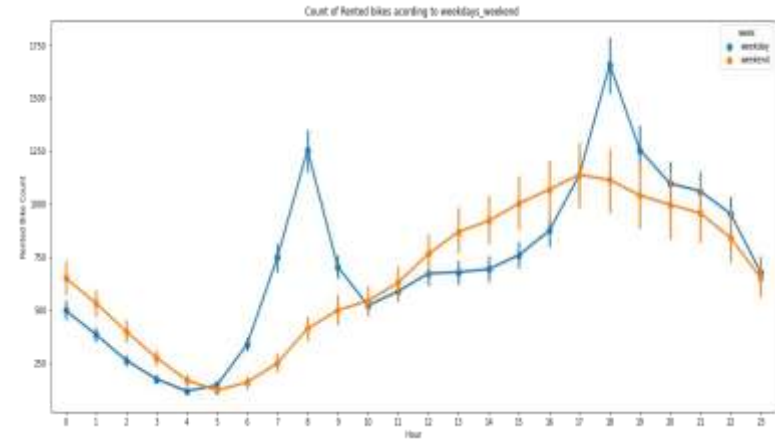

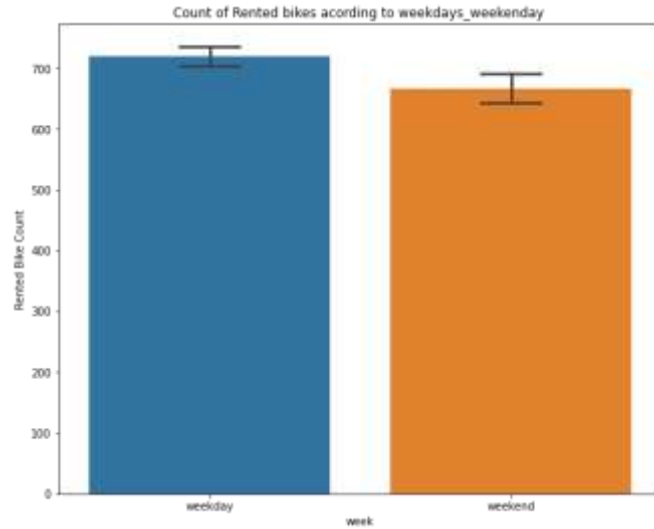

- Snowfall -cm
- Seasons -Winter, Spring, Summer, Autumn
- Holiday -Holiday/No holiday
- Functional Day -NoFunc(Non Functional Hours), Fun(Functional hours)

1. This dataset contains 8760 lines and 14 columns
2. Numerical variables -temperature, humidity,wind,visibility,dew point temp, solar radiation,rainfall,snowfall
3. Categorical variables -seasons,holiday and functioning day
4. Rented bike column -which we need to predict for new observations

# Month

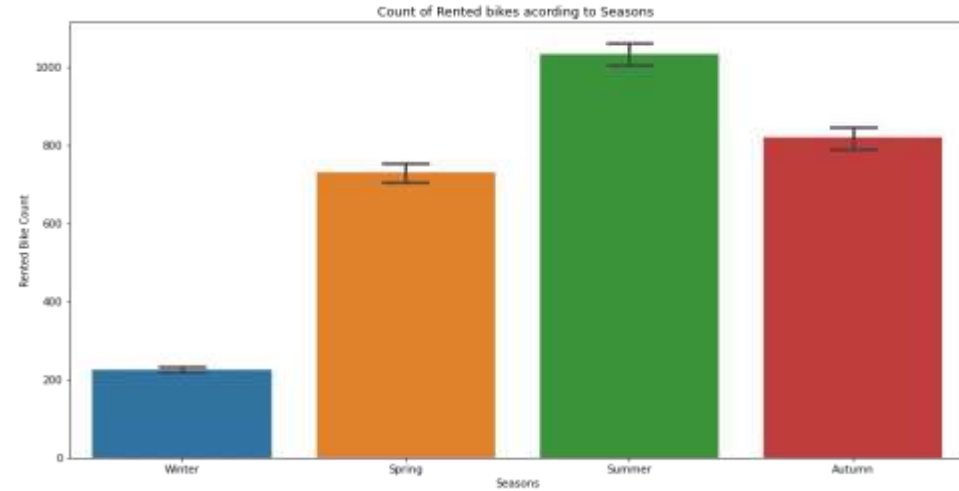

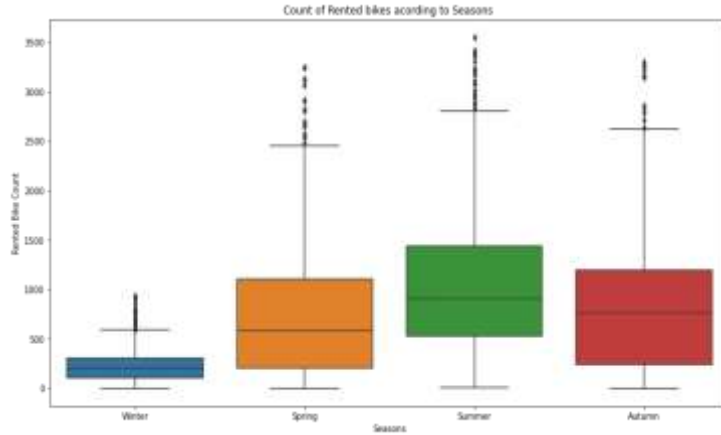

The demand of the rented bike is high from the month 5 to 10

From the above point plot and bar plot we can say that in the week days which represent in blue colour show that the demand of the bike higher because of the office. Peak Time are 7 am to 9 am and 5 pm to 7 pm The orange colour represent the weekend days, and it show that the demand of rented bikes are very low specially in the morning hour but when the evening start from 4 pm to 8 pm the demand slightly increases

# seasons

In the above box plot and bar plot which shows the use of rented bike in in four different seasons, and it clearly shows that, In summer season the use of rented bike is high In winter season the use of rented bike is very low because of snowfall.

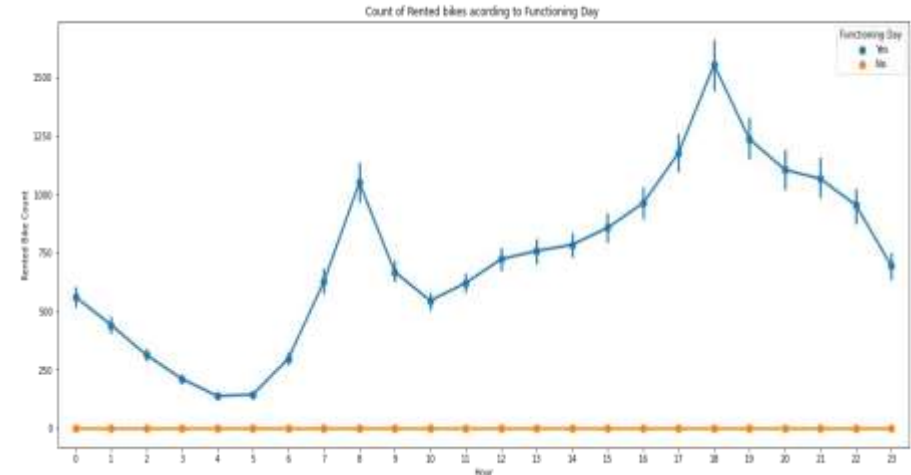

# Holiday

In the above point plot which shows the use of rented bike in a holiday, and it clearly shows that, plot shows that in holiday people uses the rented bike from 2pm-8pm

# Functioning day

In the above point plot which shows the use of rented bike in functioning day or not, and it clearly shows that, Peoples dont use reneted bikes in no functioning day

# Numerical variables

## Temperature

Above plot shows that people tend to rent bikes when the temperature is between -5 to 25 degrees.

## visibility

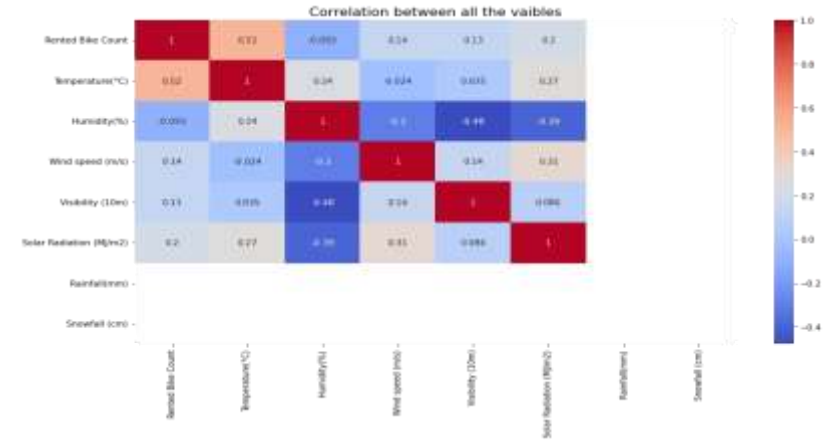

Above plot shows that people tend to rent bikes when the visibility is between 300 to 1700

# Heat map

From the above heat map i can conclude that Temperature and Dew point temperature(°C) has the high correlation . we drop this column then it dont affects the outcome of our analysis

After removing the Dew point temperature

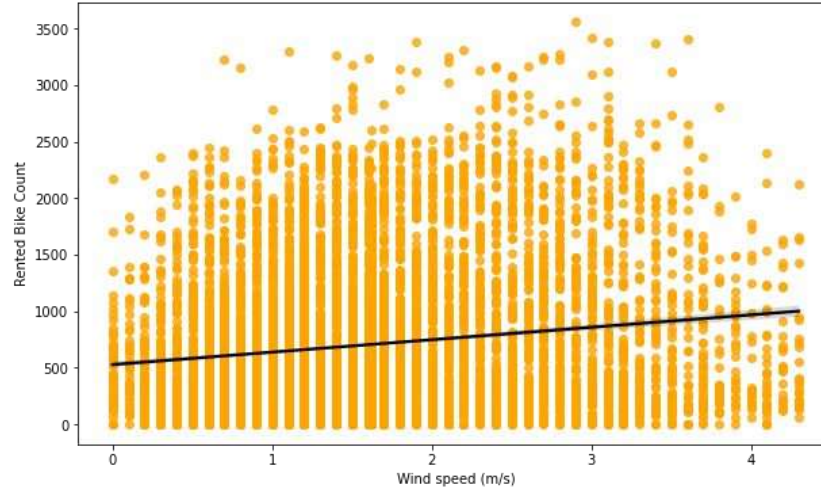

# Handling outliers

An Outlier is a data-item/object that deviates significantly from the rest of the (so-called normal) objects. The interquartile range (IQR) is the difference between the 75th and 25th percentile of the data. It is a measure of the dispersion similar to standard deviation or variance, but is much more robust against outlier

# Regression plot

- Temperature, solar radiation, wind speed, visibility are positively related to target variable, the rented bike count increases with increase of these features

# ML algorithms

1. Linear regression
2. Ridge regression
3. Elastic net
4. Decision tree
5. Random Forest regressor
6. SVR
7. Gradient boosting

- Linear regression

MSE : 61.15584375724336  
RMSE : 7.820220185982192  
MAE : 5.923260387972038  
R2 : 0.6028600936479797  
Adjusted R2 : 0.5979004370931673

- Ridge regularization

MSE : 60.83384712272495  
RMSE : 7.799605574817546  
R2 : 0.6148937632652991  
Adjusted R2 : 0.6100843884309619

- linear regression with elastic net

MSE : 61.36957118125049  
RMSE : 7.833873319198523  
MAE : 5.93382066577593  
R2 : 0.6014721692250582  
Adjusted R2 : 0.5964951796640391

## Decision tree

- The  $r^2$  score of decision tree is 0.7619882672759375
- the  $r^2$  score of decision tree with hyperparameteres tuning is 0.8013257980814106

## Random Forest Regressor with GridSearchCV

MSE= 7.548469131956553  
RMSE= 2.747447748721812  
R2\_Score\_train=  
0.9509809996888273  
MSE= 19.900384576287564  
RMSE= 4.460984709264039  
R2\_Score\_test=  
0.8740214111679199

## SVR using grid search cv

The MAE of training set = 4.312974309168605

The MSE of training set = 44.525880818380806

The R2\_score of training set = 0.7108534025195494

The MAE of test set = 4.674553587050071

The MSE of test set = 46.854036819585005

The R2\_score of test set = 0.703392393398722

## Gradient Boosting Regressor with GridSearchCV

R2 score of training data: 0.91%

R2 score of test data: 0.869495

## conclusion

- Hour of the day holds most importance among all the features for prediction of dataset
- It is observed that highest number bike rentals counts in Autumn/fall Summer Seasons and the lowest in Spring season.
- We observed that the highest number of bike rentals on a clear day and the lowest on a snowy or rainy day
- the top 5 important features of our dataset are: Season\_winter, Temperature, Hour, Season\_autumn, Humidity
- Peoples dont use rented bikes in no functioning day
- people tend to rent bikes when the temperature is between -5 to 25 degrees
- people tend to rent bikes when the visibility is between 300 to 1700
- for all the above experiments we can conclude that gradient boosting and random forest regressor with using hyperparameters we got the best results

The background is a gradient from dark purple at the top to dark blue at the bottom, overlaid with a pattern of small white stars. Faint, light-colored technical diagrams are visible, including a large circular scale with degree markings (0 to 360) and arrows in the upper right, and several concentric circles with arrows in the lower left and bottom right.
